Hiring Manager
Forensic Data Analytics — Forensic & Integrity Services
EY Australia

Dear Hiring Manager,

I am writing to apply for the **Senior Consultant** role in EY's Forensic Data Analytics team. Over five years in Australian banking and FinTech — currently leading the Intelligence and Analytics function within Financial Crime Risk at Bendigo & Adelaide Bank — I have spent my career doing exactly what this role is built around: leveraging data analytics to detect fraud, financial crime and anomalous behaviour, and translating complex datasets into evidence and insight that stakeholders can act on.

What draws me to EY's Forensic & Integrity Services is the chance to put integrity at the heart of compliance work across a diverse portfolio of clients and industries — moving from a single institution to the full life cycle of forensic data analysis, from discovery and capture through to analysis and client-ready reporting.

Detection, algorithms and analytics: I design SQL- and Python-driven analytics to surface irregular financial transactions and anomalous behaviour. Using statistical calibration and clustering on transaction monitoring models, I reduced false positives by up to **67%**, removed **5,000+** unnecessary alerts and saved **300+** hours a year, while building automated daily workflows processing **150+** alerts at **99.9%** integrity. I also build production machine learning, NLP and LLM solutions — enforcement-action checkers and typology extractors on FastAPI with vector search — to accelerate the fact-finding process.

Data engineering and ETL: I extract, validate, transform and load high-volume structured and unstructured data from disparate sources, and engineered interim SQL monitoring that held **100%** compliance continuity across **2M+** transactions during a platform exit. I work hands-on with SQL across commercial relational databases, Python and R, Spark/PySpark for big data, and AWS and GCP cloud platforms.

Reporting, visualisation and communication: I own the Power BI dashboards in our transaction monitoring product, eliminating **70%** of ad-hoc requests and cutting prioritisation time by **60%**, and co-designed an AI-driven regulatory reporting pipeline using LLMs, NLP, Python and SQL that cut preparation time by **80%**. Communicating technical information in plain language is a strength I have deliberately built — I have tutored over **100 students** in SQL and Python and regularly present data, conclusions and recommendations to non-technical stakeholders.

Alongside my **Master of Business Analytics from Deakin University**, I am beginning a formal research journey on **AI for compliance**. My grounding in financial processes and regulatory reporting means I can hypothesise, analyse and draw conclusions from financial and operational data from day one.

I would welcome the opportunity to discuss how my financial-crime analytics background can contribute to EY's Forensic Data Analytics team. My resume is attached, and I am available at your convenience.

Thank you for considering my application.

Warm regards,

Quoc Anh Trinh (Andrew)
