Hiring Manager
Data & Technology Team
Liberty Financial

Dear Hiring Manager,

I am writing to apply for the data engineering position within Liberty's Data & Technology team. As a professional who thrives in "free-thinking" environments and possesses a Master of Business Analytics, I am excited by Liberty's "AI-first" data platform direction. My experience building production-grade Python services, managing cloud infrastructure, and delivering curated data layers for both BI and AI outcomes makes me a strong fit for your modern Microsoft Fabric and Azure stack.

Liberty's reputation as a challenger in the lending space, driven by the FLAIR values, deeply resonates with my professional ethos. I am particularly drawn to the focus on being "Resourceful" and "Learning" — values that are essential when working at the bleeding edge of AI-assisted development and cloud-native data platforms. I am eager to contribute to a collaborative community that champions flexible financial solutions through exceptional digital experiences.

In my current role at Bendigo & Adelaide Bank, I lead the intelligence and analytics function within Financial Crime Risk. My technical background aligns directly with what Liberty is building:

Production-Grade Data Pipelines and Python Services: I have extensive experience designing and deploying automated workflows and Python-based services. I am comfortable working with the Medallion architecture (Bronze → Silver → Gold) to create reliable, curated data layers. My work includes building vendor-agnostic pipelines that process 150+ alerts daily with 99.9% data integrity, ensuring that data is not just available, but production-ready and high-quality.

AI-First Mindset and Intelligent Services: I am passionate about empowering AI workloads. At Bendigo, I developed automated reporting pipelines using NLP and LLMs that reduced regulatory preparation time by 80%. I understand the intricacies of powering intelligent services like speech-to-text and NLP through well-modelled data, and I am excited by the prospect of deploying these services onto modern stacks like Azure Kubernetes Service (AKS).

Infrastructure, CI/CD, and Clean Code: I value strong engineering practices, including infrastructure as code (Terraform) and robust CI/CD pipelines. I believe that data quality is sustained through automated testing, monitoring, and observability. My approach combines technical rigour with a drive for "clean code" that ensures scalability and reproducibility across the full data lifecycle.

Stakeholder Collaboration and Business Impact: I thrive on translating complex business goals into technical solutions. Whether collaborating with Risk, Data Science, or Technology teams, I focus on delivering data products that drive actual decisions. My work building Power BI dashboards has historically reduced ad-hoc reporting requests by 70%, demonstrating my ability to deliver platform-level value that empowers self-service and discoverability.

With a **Master of Business Analytics from Deakin University** and hands-on experience in AWS and Azure environments, I am a fast learner who enjoys working across domains. While I

am already proficient in SQL and Python, I am eager to further specialise in Microsoft Fabric and AI-assisted development as part of Liberty's forward-thinking team.

I am impressed by Liberty's commitment to building a social and collaborative community, and I am more than happy to support this through the three-day in-office requirement. I look forward to the opportunity to discuss how my "FLAIR" for data engineering can help shape the future of Liberty's AI-first platform.

Thank you for considering my application.

Warm regards,

Quoc Anh Trinh (Andrew)
